

We specialize in :

- All Arthroscopic Shoulder/
Rotator Cuff Surgery
- Arthroscopic Surgery for
Recurrent Shoulder Dislocation
- Arthroscopic Knee Surgery
(ACL Reconstruction and
Meniscal/Cartilage Repair)
- Partial Knee Resurfacing
- Minimally Invasive Hip and
Knee Replacement
- Arthritis and Fracture of the
Hand and Upper Extremity
- Carpal Tunnel Syndrome and
Trigger Fingers

Rotator Cuff

Shoulder pain due to the rotator cuff disease is a common problem. The shoulder is a ball and (shallow) socket joint covered by the rotator cuff. The rotator cuff is made up of four tendons/muscles that rotate the arm above the head Figure 1 and 2.

Figure 1 : Ball and shallow socket.

Figure 2: Muscles of the rotator cuff

Figure 3: Acromium bone rubbing on rotator cuff

With activity or a fall the tendon that inserts into the ball can rub against the bone above it (called the acromium and form a spur making less space for the tendons. This causes inflammation, pain, and, in the worst case, can even lead to a tear in the cuff.

Figure 4: Rotator Cuff Tear/ MRI of cuff tear

Treatment

Initial treatment centers on strengthening exercises for the rotator cuff combined with anti-inflammatory medication. If this doesn't work a cortisone injection may help. When these measures fail, we usually recommend an MRI exam and if this shows a cuff tear surgery is usually recommended. Surgery involves suturing the torn tendon back down to the ball. It can be done through a big skin incision (open) or through tiny puncture wounds using a video camera (arthroscopically) Figure 5. Arthroscopic repair is less painful and leads to less scarring postoperatively.
